

CIVORA Platform User Manual

Comprehensive Guide to Navigation, Data Operations, and Analytics Dashboard

1. Introduction to CIVORA

CIVORA is an enterprise-grade multi-project data analytics and visualization platform designed to help retail managers, executives, and data analysts extract actionable business insights from historical sales records.

The system simplifies the process of aggregating raw spreadsheet data into centralized dashboard views, enabling comparison of metrics across multiple branch locations (managed stores), categories, and timeframes.

2. Access and User Registration

To access CIVORA, open a web browser and navigate to the application dashboard URL (default local url: `http://localhost:3000`).

If you are a first-time user, click on 'Register' to create an account by providing your full name, email address, password, position (defaults to Administrator), and optional contact number. User credentials are encrypted at rest using bcrypt-based hashing.

3. Project and Store Creation

- * Creating a Store: Once logged in, navigate to the 'Projects' page. Click 'Add Project/Store' and enter store details such as name, type, segments, location id, logo URL, tax rates, and currency code.
- * Implicit Store Creation: Alternatively, if you upload a CSV/Excel file containing a 'Store' column, CIVORA will automatically scan the first row and dynamically provision a new project if the store does not already exist, associating it with your user account.

4. Data Upload and Monthly Operations

Data is ingested per reporting cycle (Month/Year). On the dashboard, click the 'Import Data' button. Select the target Month (e.g., January) and Year (e.g., 2024), and pick your data file (.csv or .xlsx). The platform performs auto-validation of columns and schema before processing data using an optimized Python engine.

5. Navigating the Dashboards

- * Global Dashboard: Access aggregate statistics across all stores, including total revenue, net revenue, total items sold, and active hubs.
- * Store-Specific Dashboard: Under 'Projects', click on a managed store. The screen shifts to store-level KPIs, monthly trends, regional breakdown charts, and category mix distribution.
