

Frequently Asked Questions (FAQ)

Answering Common Product, Technical, and Operational Queries

1. What file types are supported for data imports?

CIVORA natively supports comma-separated value files (.csv) and Microsoft Excel files (.xlsx). Ensure your sheet contains no empty rows at the top and matches the expected semantic column layout.

2. How does the system handle state and regional spelling variations?

The backend utilizes a smart alias mapping JSON configuration ('state_aliases.json'). It normalizes standard variations (e.g., 'Tamilnadu', 'TN', 'Tamil Nadu' will all be canonicalized to 'Tamil Nadu'). If a region cannot be matched, it falls back to title casing the name.

3. I uploaded data but my charts did not update. What should I do?

- * Check import period: Ensure you selected the correct month and year. The dashboard defaults to the year 2024; verify if your imported year matches the selected year filter.
- * Page refresh: Sometimes browser state updates require a manual refresh. Click F5 or reload the dashboard.
- * Server processing time: Depending on database volume, processing files may take between 2 to 5 seconds. Wait for the success notification in the top-right.

4. Can I host CIVORA on-premise without an active internet connection?

Yes. CIVORA runs fully containerized via Docker. You can deploy it locally. However, advanced AI features that call Watsonx Orchestrate require external internet connectivity to reach the APIs. Local fallbacks for reporting will still operate offline.
