

Data Upload Guide

Step-by-Step Data Preparation, Mapping, and Ingestion Workflows

1. Preparing the Source File

Your uploaded files must represent sales data for a single calendar month. Files can contain granular rows (individual sales transactions) or pre-aggregated figures grouped by product and region. Avoid formatting numbers with commas or currency symbols (e.g., use '50000', not '\$50,000').

2. Required Columns & Formats

- * Date: Values must conform to YYYY-MM-DD format (e.g., '2024-01-15').
- * Category: Category classification, such as Electronics, Furniture, Appliances, Fashion, Groceries, Books, or Stationery.
- * Region: The location or Indian state name (e.g., Maharashtra, Karnataka, Delhi).
- * Revenue: Total sales revenue in numeric format (retains up to 2 decimal places).
- * Cost: Total operating cost of the item to determine profit margins.
- * Quantity: The number of units sold (integer).

3. The Ingestion Pipeline

1. Upload: Click the 'Import Data' action in the header bar.
2. Mapping screen: If your column headers differ from the canonical names (e.g., 'total money' instead of 'revenue'), CIVORA's preview screen highlights the discrepancies. Assign columns manually or rely on CIVORA's semantic match engine.
3. Preprocessing: The Python task parses, cleans (removing bad characters, casting numbers), aggregates by dimensions, and updates database records.
4. Reload: Ingested figures are committed, and the view updates.
