

Error Codes & Troubleshooting Guide

System Alerts, Database Recovery, and Setup Debugging Procedures

1. File Upload Errors

* Error: 'Missing columns: Product, Revenue...'

Cause: The uploaded file is missing required columns. Either map headers during import or rename headers in the source file.

* Error: 'No file uploaded'

Cause: File upload request received without file content. Verify browser settings.

2. Database Connection Errors

* Error: 'ECONNREFUSED 127.0.0.1:3306'

Cause: Backend cannot connect to the MySQL database. Restart the DB container: 'docker-compose restart db'. Wait 5 seconds and reload.

* Error: 'Duplicate entry ... for key sales_summaries.project_id'

Cause: Uploading data for a month/year that already exists. CIVORA automatically overwrites the old month's summary with new figures.

3. Application Docker Failures

* Problem: Frontend won't load on http://localhost:3000.

Solution: Verify docker state: 'docker-compose ps'. Check frontend logs: 'docker-compose logs web'. Confirm port 3000 is not in use by another app.

* Problem: 'Port 3306 already in use'.

Solution: Stop local MySQL servers running outside Docker before starting the platform.
