

CIVORA Privacy Policy

Data Privacy and Processing Regulations

1. Local-First Design Principle

CIVORA is designed with a local-first architecture. All database storage and parsing happen on your local system or within private networks. CIVORA does not share your raw sales data.

2. Hashing and Authentication Data

User credentials are encrypted using bcrypt. Session tokens (JWT) are stored securely in browser local storage and transmitted via authorization headers.

3. Third-Party AI Data Processing

If you use the Watsonx Orchestrate chatbot, dashboard metrics are transmitted to the configured API. No raw file records or user passwords are sent.

4. Data Control and Deletion

You have full control over your data. Deleting a project removes its sales records and summaries from the database.
