

Data Security & Retention Policy

Policies on Data Security and Cleanup

1. Database Infrastructure Security

CIVORA uses MySQL 8.0 with Docker volume mapping. Database credentials must be configured securely in the environment file.

2. Session Security (JWT)

Authentication uses JWT with HS256 signing. Tokens expire after 7 days, requiring users to re-authenticate.

3. Data Cleaning Policy

Users can clear imported records using the dashboard settings. Deleting a store cleans up all related records in MySQL.

4. File System Cleanup

Uploaded files are deleted from the backend server immediately after processing to prevent storage leakage.
