

Administrator Guide

System Configuration, Permissions, and Deployment Guide

1. Account Roles & Multi-Tenancy

Users default to the 'Administrator' role. Multi-tenancy is enforced at the database level: users can only view and manage projects they created.

2. Database Administration

The database schema is initialized using 'init_db.sql'. Backup volume mappings are defined in 'docker-compose.yml'.

3. Deploying in Production

Before deploying, change the default JWT secret and database passwords, configure SSL, and use production-ready web servers.
